About EasySave

EasySave is an application that allows you to save data quickly and easily.

System requirements :

Available Disk Space	2198 KO
Operating System	Windows 10

How to use EasySave?

When you open the application, different fields are available to you:

- **The language**

Allows you to change the language of the EasySafe software to English, Spanish, French or German.

- **The extension files**

Allows you to select the type of extension: .txt, .docs, .csv...

For example, a "notepad" file will be in name_of_file.txt

- **The soft business**

You must write here the name of the application that will prevent the backup from being made if it is executed.

For example: "notepad", "winword" for Microsoft word or "calculator".

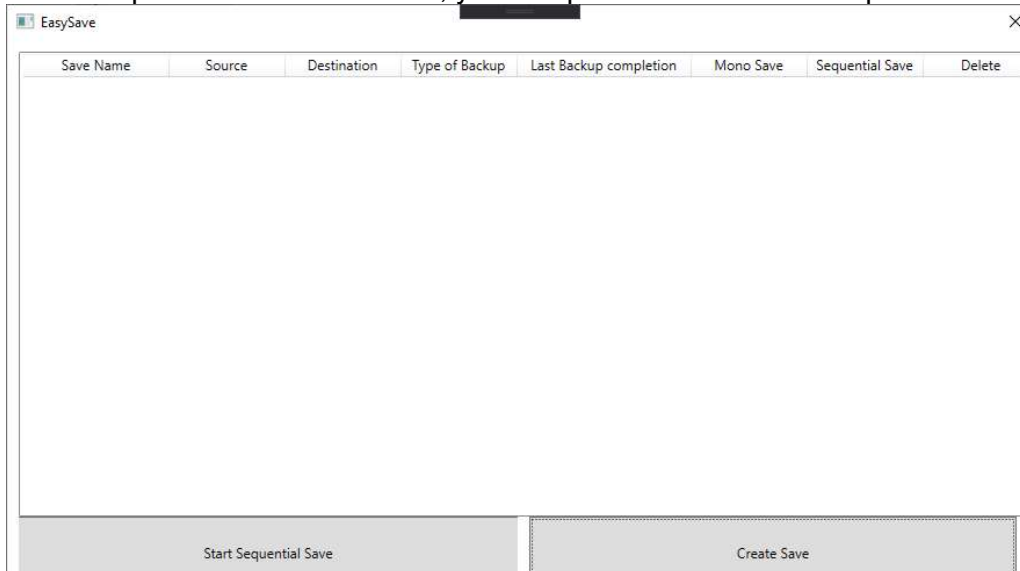

- **The CryptoSoft link**

You need here to retrieve the localization of the CryptoSoft software. You will need to copy the path with the file that opens the application.

For example: D:\Programme (x86)\CryptoSoft\CryptoSoft.exe

If you don't know where to find it go in the windows search bar and write "CryptoSoft.exe" then right click on it and finally open to the file location.

Once you have completed the various fields, you can proceed to the next step.

To start, you need to create a backup. Click on "Create Save".

There are 4 parts:

- **The Save Name**

You can choose the name of the backup you are going to make.

- **The Source link**

You can choose the link of the source file.

For example: D:\Source

- **The Destination link**

You can choose the link of the destination file.

For example: D:\Destination

- **The Types of Backup**

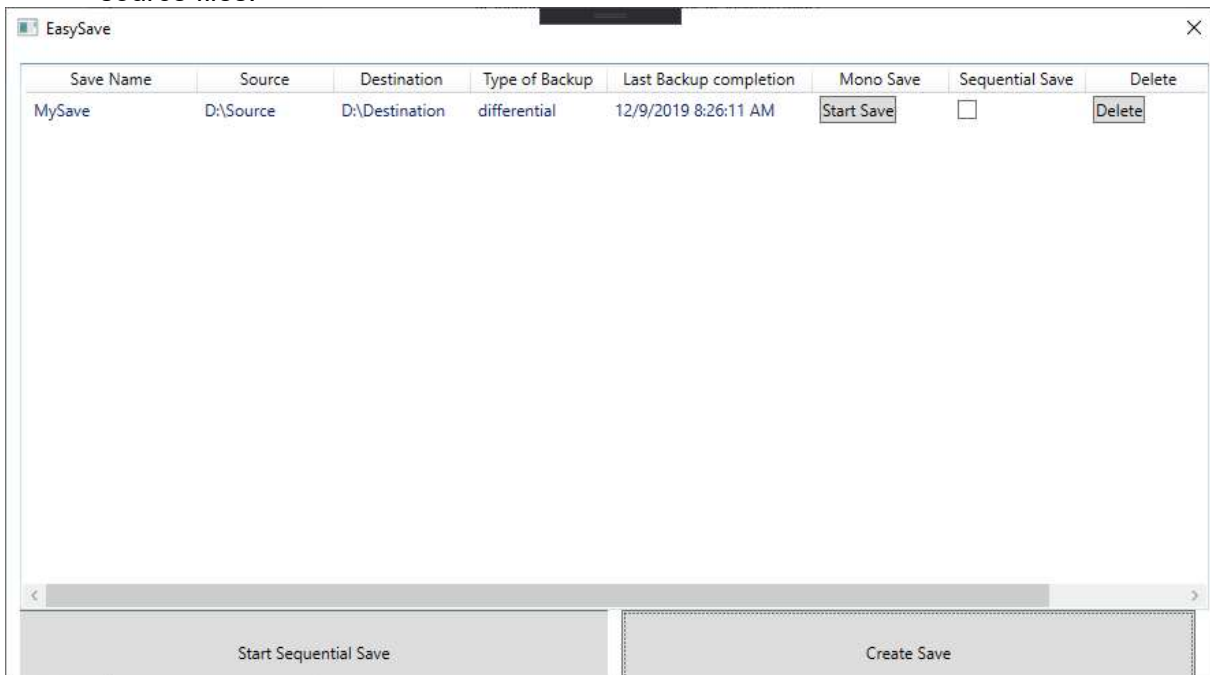

You can choose the types of Backup:

- **Differential:**

Allows you to compare the source and destination folder. Thus, data do not present in the destination file will be saved in the destination folder.

- **Mirror:**

Retrieves data from the source files, deletes data from the destination files and adds the entire source files.

When you press start, the backup starts and the CryptoSoft software will automatically use it to encrypt the data. You can also delete the backup on "delete". If you have a lot of backups to set up at once, press "Start Sequential Save" so that all your backups are created (don't forget to check "Sequential Save" on the backup).

EasySafe as easy to use as a hammer!

Find logs.

To access the Logs, do Windows+R and writing "%localappdata%". Then, press Ok. Browse for the "Apps" folder. Once the folder is found, followed by this path: "2.0\RW2WTRP1.XTQ\YZG734H3.7KM\SaveState"
